

# Summary of Product Characteristics

## 1 NAME OF THE VETERINARY MEDICINAL PRODUCT

Paramectin 1% Solution for Injection

## 2 QUALITATIVE AND QUANTITATIVE COMPOSITION

Active substance

Ivermectin 1.0 % w/v

Excipients

Non-aqueous excipients to 100 % v/v

For a full list of excipients, see section 6.1.

## 3 PHARMACEUTICAL FORM

Solution for injection.

A clear, colourless solution.

## 4 CLINICAL PARTICULARS

### 4.1 Target Species

Cattle (beef and non-lactating dairy cattle) and pigs.

### 4.2 Indications for use, specifying the target species

#### **Cattle**

In cattle, treatment of infections by the following parasites:

#### **Gastrointestinal roundworms (adults and fourth stage larvae):**

*Ostertagia ostertagi* (including inhibited *O ostertagi*), *Ostertagia lyrata*, *Haemonchus placei*, *Trichostrongylus axei*, *Trichostrongylus colubriformis*, *Cooperia oncophora*, *Cooperia punctata*, *Cooperia pectinata*, *Bunostomum phlebotomum*, *Oesophagostomum radiatum*, *Nematodirus helvetianus* (adult)

#### **Lungworms**(adult and fourth stage larvae):

*Dictyocaulus viviparus*

#### **Warbles (parasitic stages):**

*Hypoderma bovis*, *Hypoderma lineatum*

**Sucking Lice:**

*Linognathus vituli, Haematopinus eurysternus, Solenopotes capillatus*

**Mange Mites:**

*Psoroptes bovis, Sarcoptes scabiei var bovis*

Paramectin Injection may also be used to reduce infection of the mange mite *Chorioptes bovis*, but complete elimination may not occur

**Pigs**

In pigs: treatment of infections by the following parasites:

**Gastrointestinal roundworms:**

*Ascaris suum*(adults and fourth-stage larvae)

*Hyostrogylus rubidus*(adults and fourth-stage larvae)

*Oesophagostomum*spp (adults and fourth-stage larvae)

*Strongyloides ransomi*(adults)

**Lungworms:**

*Metastrongylus*spp (adults)

**Lice:**

*Haematopinus suis*

**Mange mites:**

*Sarcoptes scabiei*var *suis*

**4.3 Contraindications**

Not permitted for use in lactating cows producing milk for human consumption. Do not use in non-lactating dairy cows including pregnant dairy heifers within 60 days of calving.

Do not use in dogs or cats as severe adverse reactions may occur.

The product is not for intravenous or intramuscular use.

Do not use in cases of known hypersensitivity to the active ingredient.

**4.4 Special warnings for each target species**

None.

## **4.5 Special precautions for use**

### **Special precautions for use in animals**

To avoid secondary reactions due to the death of Hypoderma larvae in the oesophagus or in the spine it is recommended to administer the product at the end of warble fly activity and before the larvae reach their resting sites. Consult your veterinarian on the correct timing of treatment.

Parasite resistance to any particular class of anthelmintic may develop following frequent, repeated use of an anthelmintic of that class. It is important that the correct dose is given in order to minimise the risk of resistance. To avoid under dosing animals should be grouped according to their body weight and dosed according to the heaviest animal in the group

The product has been formulated specifically for cattle and pigs. It should not be administered to other species as severe adverse reactions may occur. Cases of intolerance with fatal outcome are reported in dogs, especially Collies, old English Sheepdogs and related breeds or crosses, and also in turtles/tortoises.

Since ivermectin is highly bound to plasma proteins, special care should be taken in cases of sick animals or in nutritional conditions associated with low plasma protein levels.

### **Special precautions to be taken by the person administering the veterinary medicinal product to animals**

Should any apparent growth or discolouration occur the product should be discarded.

Do not smoke or eat while handling the product.

Direct contact of the product with the skin should be avoided.

Wash hands after use.

Take care to avoid self-injection. Inadvertent self-injection may result in local irritation and/or pain at the injection site.

## **4.6 Adverse reactions (frequency and seriousness)**

Transitory discomfort has been observed in some cattle following subcutaneous administration. Some soft tissue swelling at injection site has been commonly observed. These reactions disappear without treatment.

Mild and transient pain and/or swelling reactions may be seen in some pigs following subcutaneous injection. All these reactions disappear without treatment.

#### **4.7 Use during pregnancy, lactation or lay**

The product can be administered to beef cows at any stage of pregnancy or lactation provided that the milk is not intended for human consumption.

Not permitted for use in lactating cows producing milk for human consumption. Do not use in non-lactating dairy cows including pregnant dairy heifers within 60 days of calving.

The product can be administered to sows at any stage of pregnancy or lactation.

#### **4.8 Interaction with other medicinal products and other forms of interactions**

None known.

#### **4.9 Amounts to be administered and administration route**

For single administration only.

Bodyweight and dosage should be accurately determined prior to treatment to avoid underdosing.

##### ***Cattle***

Ivermectin should be administered at a dosage rate of 200 microgram per kg bodyweight (1 ml/50 kg). It should be injected subcutaneously in front of or behind the shoulder using aseptic technique. A sterile 17-gauge, half-inch needle is recommended. Use of a draw-off needle is recommended to avoid excess broaching of the stopper. No untreated cattle should be added to the pasture. Treated animals should be monitored according to good husbandry practices always.

##### ***Pigs***

The product should be administered at a dosage rate of 300 microgram per kg bodyweight (1 ml/33 kg). It should be injected subcutaneously into the neck using aseptic technique. A sterile 17-gauge, half-inch needle is recommended. Exact dosing is important especially in pigs with low bodyweight, therefore a syringe capable of dosing in 0.1 ml steps should be used.

The treatment schedule should be based on the local epidemiological situation.

#### **4.10 Overdose (symptoms, emergency procedures, antidotes), if necessary**

In the case of overdose a symptomatic treatment should be given. The symptoms of overdose can be trembling, convulsions and coma.

A dose of 30 mg ivermectin per kg (100 x the recommended dose of 0.3 mg per kg) injected subcutaneously to pigs caused lethargy, ataxia, bilateral mydriasis, intermittent tremors, laboured breathing and lateral recumbency.

In cattle, a single dose of 4.0 mg ivermectin per kg (20 times the use level) given subcutaneously resulted in ataxia and depression.

No systemic or local signs of toxic effects were reported at 3 times the recommended dose in both species – cattle and pigs.

#### **4.11 Withdrawal period(s)**

##### ***Cattle***

Meat and offal: 49 days

Not permitted for use in lactating cows producing milk for human consumption. Do not use in non-lactating dairy cows including pregnant dairy heifers within 60 days of calving.

##### ***Pigs***

Meat and Offal: 18 days

### **5 PHARMACOLOGICAL or IMMUNOLOGICAL PROPERTIES**

Pharmacotherapeutic group: Endectocide

ATC vet code: QP54AA01

#### **5.1 Pharmacodynamic properties**

Ivermectin is a macrocyclic lactone derivative and acts by inhibiting nerve impulses. It binds selectively and with high affinity to glutamate-gated chloride ion channels which occur in invertebrate nerve and muscle cells. This leads to an increase in the permeability of the cell membrane to chloride ions with hyperpolarization of the nerve or muscle cell, resulting in paralysis and death of the relevant parasites.

Compounds of this class may also interact with other ligand-gated chloride channels, such as those gated by the neurotransmitter gamma-aminobutyric acid (GABA). The margin of safety for compounds of this class is attributable to the fact that mammals do not have glutamate-gated chloride channels.

The macrocyclic lactones have a low affinity for other mammalian ligand-gated chloride channels and they do not readily cross the blood-brain barrier.

## 5.2 Pharmacokinetic particulars

After subcutaneous administration of the recommended dose of the product to cattle (200 µg/kg), the following parameters were observed: C<sub>max</sub> of 37 ng/ml and AUC of 7558 ng/ml.h. After subcutaneous administration of the recommended dose of the product to pigs (300 µg/kg), the following parameters were observed: C<sub>max</sub> of 14 ng/ml, and AUC of 1887 ng/ml.h. Ivermectin is only partially metabolised. In cattle, only about 1-2% is excreted in the urine; the remainder is excreted in the faeces, approximately 60% of which is excreted as unaltered drug. The remainder is excreted as metabolites or degradation products. Biliary excretion, followed by elimination in faeces is probably the major route of ivermectin excretion in pigs.

## 6 PHARMACEUTICAL PARTICULARS

### 6.1 List of excipients

Glycerol formal  
Polyethylene glycol 200

### 6.2 Major incompatibilities

None known.

### 6.3 Shelf-life

Shelf-life: 2 years  
After first opening of the container: 28 days

### 6.4 Special precautions for storage

Do not store above 25°C.  
Protect from direct sunlight.

### 6.5 Nature and composition of immediate packaging

The product will be supplied in 50 ml, 100 ml, 250 ml, 500 ml and 1 litre volumes, presented in high density polyethylene vials with bromobutyl bungs and aluminium caps.

Not all pack sizes may be marketed.

## **6.6 Special precautions for the disposal of unused veterinary medicinal products or waste materials derived from the use of such products**

Ivermectin is extremely dangerous to fish and aquatic life. Do not contaminate surface water or ditches with the product or used containers. Any unused product or waste material should be disposed of safely in accordance with national requirements.

## **7 MARKETING AUTHORISATION HOLDER**

Norbrook Laboratories (Ireland) Limited  
Rossmore Industrial Estate  
Monaghan  
Ireland

## **8 MARKETING AUTHORISATION NUMBER(S)**

VPA22664/065/001

## **9 DATE OF FIRST AUTHORISATION/RENEWAL OF THE AUTHORISATION**

Date of first authorisation: 29 June 2001  
Date of last renewal: 30 October 2015

## **10 DATE OF REVISION OF THE TEXT**

January 2019
