ANNEX I SUMMARY OF PRODUCT CHARACTERISTICS

1. NAME OF THE VETERINARY MEDICINAL PRODUCT

Synchromate 250 micrograms/ml solution for injection

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each ml contains:

Active substance:

Cloprostenol 250 micrograms (equivalent to 263 micrograms of cloprostenol sodium)

Excipients:

Qualitative composition of excipients and other constituents	Quantitative composition if that information is essential for proper administration of the veterinary medicinal product
Chlorocresol	1.0 mg
Citric acid monohydrate	-
Ethanol (96 per cent)	-
Sodium chloride	-
Sodium citrate	-
Water for injections	-

Clear, colorless solution, practically free from particles.

3. CLINICAL INFORMATION

3.1 Target species

Cattle (cows and heifers), pigs (sows and gilts) and horses (mares)

3.2 Indications for use, for each target species

Cattle (Cows and heifers):

- Oestrus induction and synchronisation in cows and heifers with a functional corpus luteum.
- Induction of oestrus as an aid to management of suboestrus ('silent heat').
- Treatment of clinical and subclinical endometritis in the presence of a functional corpus luteum.
- Treatment of ovarian luteal cysts.
- Induction of parturition after day 270 of gestation.
- Induction of abortion up to day 150 of gestation.

Pigs (sows and gilts):

- Induction of farrowing one or two days before the estimated date of parturition. Horses (mares):

- Oestrus induction and synchronisation in mares with a functional corpus luteum.
- Termination of early pregnancy between day 5 and day 120 of gestation.

3.3 Contraindications

Do not use in pregnant animals in which the induction of abortion or parturition is not intended. Do not administer to induce parturition in animals with suspected dystocia due to mechanical obstruction or abnormal position, presentation and/or posture of the foetus.

Do not use in animals with compromised cardiovascular function, bronchospasm or gastrointestinal dysmotility.

Do not use in cases of hypersensitivity to active substance or to any of the excipients.

3.4 Special warnings

There is a refractory period of several days after ovulation (e.g. four to five days in cattle and horses), when females are insensitive to the luteolytic effect of prostaglandins.

For the termination of gestation in cattle, best results are obtained before day 100 of gestation. Results are less reliable between day 100 and 150 of gestation.

The response of sows and gilts to induction of parturition may be influenced by the physiological state and the time of treatment. The vast majority of animals, 95%, will commence farrowing within 36 hours of treatment. The majority of animals can be expected to respond within the period of 24+/-5 hours following the injection, except in those cases where spontaneous parturition is imminent.

3.5 Special precautions for use

Special precautions for safe use in use in the target species:

To reduce the risk of anaerobic infections arising from vasoconstriction at the injection site, injections into contaminated (wet or dirty) skin areas should be avoided. Thoroughly clean and disinfect injection sites prior to administration.

Do not administer intravenously.

All animals should receive adequate supervision after treatment.

Induction of parturition or abortion may cause dystocia, stillbirth and/or metritis. The incidence of retained placenta may be increased depending on the time of treatment relative to the date of conception.

Premature induction of farrowing will reduce the piglet's birth weight and increase the number of stillborn piglets and non-viable and immature born piglets. It is essential that the mean length of gestation is calculated on each farm from past records and not to anticipate the term of gestation by more than two days.

Injection into adipose tissue can result in incomplete absorption of the veterinary medicinal product. Cloprostenol may cause effects related to Prostaglandin $F2\alpha$ activity in the smooth muscles, such as increased frequency of urination and defecation.

Special precautions to be taken by the person administering the veterinary medicinal product to animals

Prostaglandins of the $F2\alpha$ type, such as cloprostenol, may be absorbed through the skin and may cause bronchospasm or miscarriage. Care should be taken when handling the veterinary medicinal product to avoid self-injection or skin contact.

Pregnant women, women of childbearing age, asthmatics and persons with other respiratory tract diseases should avoid contact when handling this veterinary medicinal product. Personal protective equipment consisting of impervious gloves should be worn when handling the veterinary medicinal product.

Accidental spillage on the skin should be washed immediately soap and water. In case of accidental self-injection or spillage onto the skin seek medical advice immediately, particularly as shortness of breath may occur, and show the package leaflet or label to the physician.

This veterinary medicinal product may cause skin and eye irritation. Avoid contact with skin and eyes. In case of accidental exposure, rinse the affected area thoroughly with water.

This veterinary medicinal product may cause hypersensitive reactions. People with known hypersensitivity to cloprostenol y/o chlorocresol should avoid contact with the veterinary medicinal product.

Wash hands after use.

Special precautions for the protection of the environment:

Not applicable.

3.6 Adverse events

Cattle (cows and heifers):

Rare	Injection site infection ¹ :
(1 to 10 animals / 10,000 animals treated):	
Very rare	Anaphylaxis ² ;
(<1 animal / 10,000 animals treated,	Increased respiratory rate ³ ;
including isolated reports):	Increased heart rate ³ ;
	Abdominal pain ³ , Diarrhoea ^{3,5} ;
	Incoordination ³ ;
	Lying down ³ ;
	Retained placenta ⁴ , Metritis ⁴ , Dystocia ⁴ , Stillbirth ⁴ ;
	Restlessness, Frequent urination ^{3,5} ;

¹ May occur if anaerobic bacteria enter the injection site, especially following intramuscular injection, and may become generalized. Aggressive antibiotic therapy, particularly covering clostridial species, should be employed at the first sign of infection. Careful aseptic techniques should be employed to decrease the possibility of these infections.

² Requiring immediate medical attention. Can be life-threatening.

 $^{^{3}}$ Cloprostenol may cause effects similar to Prostaglandin F2α activity in the smooth muscles. 4 May be caused by induction of parturition or abortion. As part of induction of parturition, depending on the date of treatment versus the date of conception, the incidence of placental retention may be increased. 5 In case of occurrence, these effects are observed within 15 minutes post-injection and usually disappear after one hour.

Pigs (sows and gilts):

Rare	Injection site infection ¹
(1 to 10 animals / 10,000 animals treated):	
Very rare	Anaphylaxis ² ;
(<1 animal / 10,000 animals treated,	Increased respiratory rate ³ ;
including isolated reports):	Increased heart rate ³ ;
	Abdominal pain ³ , Diarrhoea ^{3,5} ;
	Incoordination ³ ;
	Lying down ³ ;
	Retained placenta ⁴ , Metritis ⁴ , Dystocia ⁴ ,
	Stillbirth ⁴ ;
	Restlessness, Frequent urination ^{3,5} ;

¹ May occur if anaerobic bacteria enter the injection site, especially following intramuscular injection, and may become generalized. Aggressive antibiotic therapy, particularly covering clostridial species, should be employed at the first sign of infection. Careful aseptic techniques should be employed to decrease the possibility of these infections.

Horses (mares):

Uncommon	Abnormal oestrus ¹ ;
(1 to 10 animals / 100 animals treated):	
Rare	Injection site infection ²
(1 to 10 animals / 10,000 animals treated)	
Very rare	Anaphylaxis ³ ;
(<1 animal / 10,000 animals treated,	Increased respiratory rate ⁴ ;
including isolated reports):	Increased heart rate ⁴ ;
	Increased sweating ^{4,5} ;
	Abdominal pain ⁴ , Colic ⁶ , Diarrhoea ^{4,8} ;
	Incoordination ⁴ , Muscle tremor ⁵ ;
	Lying down ⁴ , Decreased body temperature ⁴ ;
	Retained placenta ⁷ , Metritis ⁷ , Dystocia ⁷ ,
	Stillbirth ⁷ ;
	Restlessness, Frequent urination ^{4,8} ;

¹ Haemorrhagic (anovular) follicles and multiple ovulations are reported in literature for horses treated with cloprostenol.

² Requiring immediate medical attention. Can be life-threatening.

³ Cloprostenol may cause effects similar to Prostaglandin F2α activity in the smooth muscles.

⁴ May be caused by induction of parturition. As part of induction of parturition, depending on the date of treatment versus the date of conception, the incidence of placental retention may be increased.

⁵ In case of occurrence, these effects are observed within 15 minutes post-injection and usually disappear after one hour.

² May occur if anaerobic bacteria enter the injection site, especially following intramuscular injection, and may become generalized. Aggressive antibiotic therapy, particularly covering clostridial species, should be employed at the first sign of infection. Careful aseptic techniques should be employed to decrease the possibility of these infections.

³ Requiring immediate medical attention. Can be life-threatening.

⁴ Cloprostenol may cause effects similar to Prostaglandin F2α activity in the smooth muscles.

⁵ Appears to be transient and resolves without any treatment.

Reporting adverse events is important. It allows continuous safety monitoring of a veterinary medicinal product. Reports should be sent, preferably via a veterinarian, to either the marketing authorisation holder or its local representative or the national competent authority via the national reporting system. See the package leaflet for respective contact details.

3.7 Use during pregnancy, lactation or lay

Pregnancy:

Do not use in pregnant animals in which the induction of abortion or parturition is not intended.

Lactation:

The product can be used during lactation.

Fertility:

Cloprostenol has a large safety margin and does not negatively affect fertility in cattle. Nor have any harmful effects been reported in the offspring of an insemination or mating following treatment with this veterinary medicinal product for conception products obtained after treatment.

3.8 Interaction with other medicinal products and other forms of interaction

The concomitant use of oxytocin and cloprostenol increases the effects on the uterus.

The concomitant use of progestogens decreases the effect of cloprostenol.

Do not administer with non-steroidal anti-inflammatory drugs (NSAIDs) since they inhibit endogenous prostaglandin synthesis.

3.9 Administration routes and dosage

Intramuscular use.

Cattle (cows and heifers):

One dose equals 500 micrograms of cloprostenol per animal, corresponding to 2 ml of the veterinary medicinal product.

Oestrus induction and synchronisation:

Administer one dose per animal. When no oestrus symptoms are observed, a second dose can be administered after 11 days.

Treatment of clinical and subclinical endometritis in the presence of a functional corpus luteum: Administer one dose per animal. If necessary, repeat the treatment 10-14 days later.

Treatment of ovarian luteal cysts:

Administer a single dose per animal.

Induction of parturition

Administer a single dose per animal, not earlier than 10 days before the expected date of calving.

⁶ Mild.

⁷ May be caused by termination of gestation, depending on the date of treatment versus the date of conception, the incidence of placental retention may be increased.

⁸ In case of occurrence, these effects are observed within 15 minutes post-injection and usually disappear after one hour.

Induction of abortion up to day 150 of gestation:

Administer a single dose per animal, between the 5th and the 150th day of gestation.

Pigs (sows and gilts):

One dose equals 175 micrograms of cloprostenol per animal, corresponding to 0.7 ml of the veterinary medicinal product.

Induction of farrowing:

Administer a single dose per animal one or two days before the estimated date of parturition (see also warnings in section 3.5).

To be administered by deep intramuscular route with a needle at least 4 cm long.

Horses (mares):

Ponies and horses weighing less than 500 kg bodyweight:

One dose equals 125 - 250 micrograms of cloprostenol per animal, corresponding to 0.5 - 1 ml of the veterinary medicinal product.

Horses weighing more than 500 kg bodyweight:

One dose equals 250 - 500 micrograms of cloprostenol per animal, corresponding to 1 - 2 ml of the veterinary medicinal product.

Oestrus induction and synchronisation:

Administer a single dose per animal.

Termination of early gestation between day 5 and day 120:

Administer a single dose per animal, not earlier than 5 days after ovulation.

For 10 ml and 20 ml vials:

The rubber stoppers of the vial may be safely punctured up to 10 times with 16-gauge needle.

For 50 ml and 100 ml vial:

The rubber stoppers of the vial may be safely punctured up to 10 times with 16-gauge needle. Otherwise, automatic syringe equipment, or a suitable draw-off needle, should be used to avoid excessive puncturing of the closure.

3.10 Symptoms of overdose (and where applicable, emergency procedures and antidotes)

Cattle: At 5x to 10x overdose the most frequent side effect is increased rectal temperature. This is usually transient, however, and not detrimental to the animal. Limited salivation or transient diarrhoea may also be observed in some animals.

Horses: The most frequently observed side effects are sweating and decreased rectal temperatures. These are usually transient, however, and not detrimental to the animal. Other possible reactions are increased heart rate, increased respiratory rate, abdominal discomfort, locomotor incoordination and lying down. If these occur, they are likely to be seen within 15 minutes of injection and disappear within 1 hour. Mares usually continue to eat throughout.

Pigs: In general, an overdose can lead to the following symptoms: increased heart and respiratory rate, bronchoconstriction, increased body temperature, increased amounts of faeces and urine, salivation, nausea and vomiting. In worse cases transient diarrhoea may occur.

There are no antidotes available, treatment should be symptomatic, assuming that prostaglandin $F2\alpha$ influences the smooth muscle cells.

3.11 Special restrictions for use and special conditions for use, including restrictions on the use of antimicrobial and antiparasitic veterinary medicinal products in order to limit the risk of development of resistance

Not Applicable.

3.12 Withdrawal period

Cattle:

Meat and offal: 1 day. Milk: Zero hours.

Pigs:

Meat and offal: 1 day.

Horses:

Meat and offal: 2 days.

Milk: 24 hours.

4. PHARMACOLOGICAL INFORMATION

4.1 ATCvet code:

QG02AD90

4.2 Pharmacodynamic

Cloprostenol sodium, a (racemic) analogue of prostaglandin $F_{2\alpha}$ (PGF_{2 α}), is a very potent luteolytic agent. It causes functional and morphological regression of the corpus luteum (luteolysis) followed by return to oestrus and normal ovulation.

Furthermore, this group of substances has a contractile effect on the smooth muscles (uterus, gastro-intestinal tract, respiratory tract, vascular system).

The veterinary medicinal product does not demonstrate any androgenic, oestrogenic or anti progesterone activity and its effect on pregnancy is due to its luteolytic property.

Unlike other prostaglandin analogues, cloprostenol has no thromboxane A₂ activity and does not cause platelet aggregation.

4.3 Pharmacokinetic

Metabolism studies, using 15-¹⁴C-cloprostenol have been performed in pigs and cattle (by IM administration) to determine residue levels.

The kinetic studies indicate that the compound is rapidly absorbed from the site of injection, is metabolised then excreted in approximately equal proportion in urine and faeces. In cattle, less than 1% of the administered dose is eliminated via milk. The major route of metabolism appears to be β -oxidation to the tetranor or dinor acids of cloprostenol.

Peak values of radioactivity in blood were observed within 1 hour of a parenteral dose and declined with a $t_{1/2}$ of between 1-3 hours depending on species.

5. PHARMACEUTICAL PARTICULARS

5.1 Major incompatibilities

In the absence of compatibility studies, this veterinary medicinal product must not be mixed with other veterinary medicinal products.

5.2 Shelf life

Shelf life of the veterinary medicinal product as packaged for sale: 3 years Shelf life after first opening the immediate packaging: 28 days

5.3 Special precautions for storage

Keep the vial in the outer carton in order to protect from light.

5.4 Nature and composition of immediate packaging

For 20 ml: Clear glass vials of glass type I with Ph. Eur type I bromobutyl rubber stopper and aluminum cap

For 10 ml: Clear glass vials of glass type I with Ph. Eur type I laminated elastomeric bromobutyl rubber stopper and aluminum cap

For 50 ml: Clear glass vials of glass type I with Ph. Eur. Type I bromobutyl rubber stopper and aluminum cap

For 100 ml: Clear glass vials of glass type I with Ph. Eur. Type I bromobutyl rubber stopper and aluminum cap

Pack sizes:

Cardboard box containing 1vial of 10ml

Cardboard box containing 5 vials of 10ml

Cardboard box containing 12 vials of 10ml

Cardboard box containing 1 vial of 20ml

Cardboard box containing 5 vials of 20ml

Cardboard box containing 12 vials of 20ml

Cardboard box containing 1 vial of 50ml

Cardboard box containing 1 vial of 100ml

Not all pack sizes may be marketed.

5.5 Special precautions for the disposal of unused veterinary medicinal product or waste materials derived from the use of such products

Medicines should not be disposed of via wastewater or household waste.

The veterinary medicinal product should not enter water courses as cloprostenol may be dangerous for fish and other aquatic organisms.

Use take-back schemes for the disposal of any unused veterinary medicinal product or waste materials derived thereof in accordance with local requirements and with any national collection systems applicable to the veterinary medicinal product concerned.

6. NAME OF THE MARKETING AUTHORISATION HOLDER

Alivira Animal Health Limited

7. MARKETING AUTHORISATION NUMBER(S)

8. DATE OF FIRST AUTHORISATION

Date of first authorization:

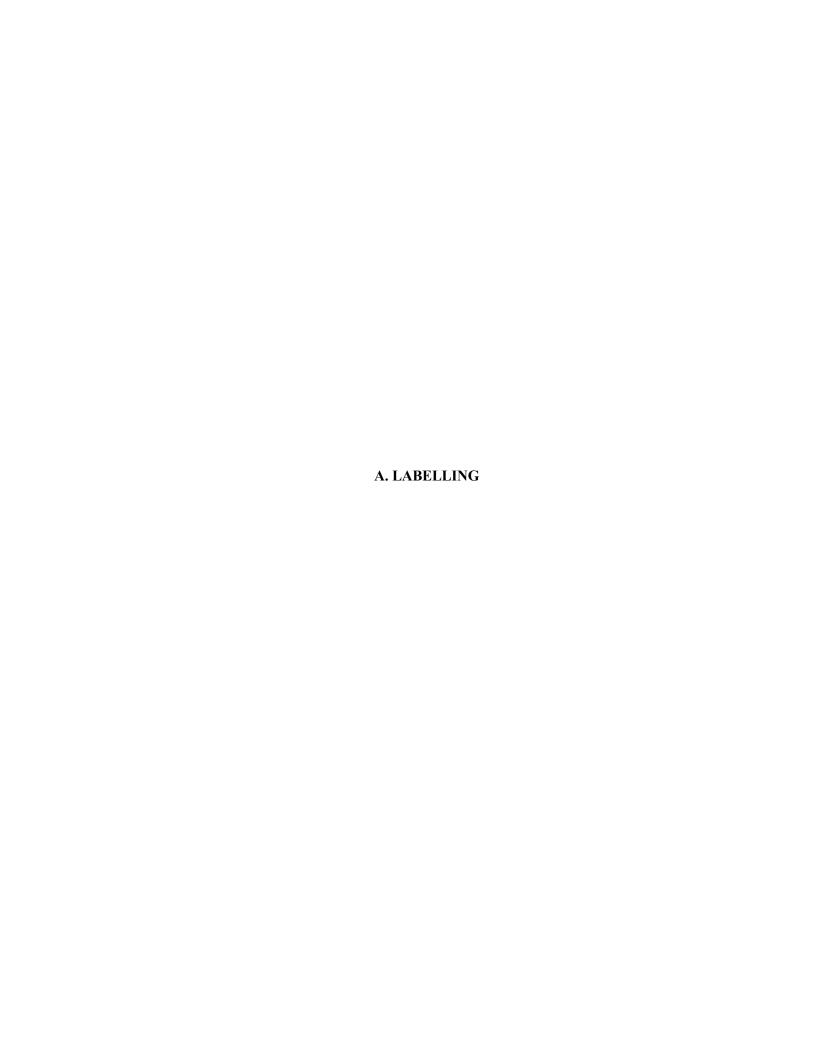

9. DATE OF THE LAST REVISION OF THE SUMMARY OF THE PRODUCT CHARACTERISTICS

10. CLASSIFICATION OF VETERINARY MEDICINAL PRODUCTS

Veterinary medicinal product subject to prescription.

Detailed information on this veterinary medicinal product is available in the <u>Union Product Database</u> (https://medicines.health.europa.eu/veterinary).

2. Composition

Each ml contains:

Active substance:

Cloprostenol 250 micrograms (equivalent to 263 micrograms cloprostenol sodium)

Excipients:

Chlorocresol 1.0 mg

Clear, colorless solution, practically free from particles.

3. Target species

Cattle (cows and heifers), pigs (sows and gilts) and horses (mares)

4. Indications for use

Cattle (Cows and heifers):

- Oestrus induction and synchronisation in cows and heifers with a functional corpus luteum.
- Induction of oestrus as an aid to management of suboestrus ('silent heat').
- Treatment of clinical and subclinical endometritis in the presence of a functional corpus luteum (inflammation of the uterus).
- Treatment of ovarian luteal cysts- Induction of parturition after 270 days of gestation
- Induction of abortion up to day 150 of gestation.

Pigs (sows and gilts):

- Induction of farrowing one or two days before the estimated date of parturition.

Horses (mares):

- Oestrus induction and synchronisation in mares with a functional corpus luteum.
- Termination of early pregnancy between day 5 and day 120 of gestation.

5. Contraindications

Do not use in pregnant animals in which abortion or parturition is not intended.

Do not administer to induce parturition in animals with suspected dystocia (difficult parturition) due to mechanical obstruction or abnormal position, presentation and/or posture of the foetus.

Do not use in animals with compromised cardiovascular function, bronchospasm or gastrointestinal dysmotility.

- Do not use in case of hypersensitivity to active substance or to any of the excipients.

6. Special warnings

There is a refractory period of several days after ovulation (e.g. four to five days in cattle and horses), when females are insensitive to the luteolytic effect of prostaglandins.

For the termination of gestation in cattle, best results are obtained before day 100 of gestation. Results are less reliable between day 100 and 150 of gestation.

The response of sows and gilts to induction of parturition may be influenced by the physiological state and the time of treatment. The vast majority of animals, 95%, will commence farrowing within 36 hours of treatment. The majority of animals can be expected to respond within the period of 24+/-5 hours following the injection, except in those cases where spontaneous parturition is imminent.

Special precautions for safe use in the target species:

To reduce the risk of anaerobic infectionsarising from vasoconstriction at the injection site, injections into contaminated (wet or dirty) skin areas should be avoided. Thoroughly clean and disinfect injection sites prior to administration.

Do not administer intravenously.

All animals should receive adequate supervision after treatment.

Induction of parturition or abortion may cause dystocia (difficult parturition), stillbirth and/or metritis (inflammation of the uterus). The incidence of retained placenta may be increased depending on the time of treatment relative to the date of conception.

Premature induction of farrowing will reduce the piglet's birth weight and increase the number of stillborn piglets and non-viable and immature born piglets. It is essential that the mean length of gestation is calculated on each farm from past records and not to anticipate the term of gestation by more than two days.

Injection into adipose tissue can result in incomplete absorption of the product.

Cloprostenol may cause effects related to Prostaglandin $F2\alpha$ activity in the smooth muscles, such as increased frequency of urination and defecation.

Special precautions to be taken by the person administering the veterinary medicinal product to animals

Prostaglandins of the $F2\alpha$ type, such as cloprostenol, may be absorbed through the skin and may cause bronchospasm or miscarriage. Care should be taken when handling the veterinary medicinal product to avoid self-injection or skin contact,

Pregnant women, women in childbearing age, asthmatics and persons with other respiratory tract diseases should avoid contact when handling this veterinary medicinal product. Personal protective

equipment consisting of impervious gloves should be worn when handling the veterinary medicinal product.

Accidental spillage on the skin should be washed immediately with soap and water. In case of accidental self-injection or spillage onto skin, seek medical advice immediately, particularly as shortness of breath may occur, and show the package leaflet or label to the physician.

This veterinary medicinal product may cause skin and eye irritation. Avoid contact with skin and eyes. In case of accidental exposure, rinse the affected area thoroughly with water.

This veterinary medicinal product may cause hypersensitive reactions. People with known hypersensitivity to cloprostenol y/o chlorocresol should avoid contact with the veterinary medicinal product.

Wash hands after use.

Pregnancy

Do not use in pregnant animals in which the induction of abortion or parturition is not intended.

<u>Lactation</u>:

The product can be used during lactation.

Fertility:

Cloprostenol has a large safety margin and does not negatively affect fertility in cattle. Nor have any harmful effects been reported in the offspring of an insemination or mating following treatment with this veterinary medicinal product for conception products obtained after treatment.

Interaction with other medicinal products and other forms of interaction:

The concomitant use of oxytocin and cloprostenol increases the effect on the uterus.

The concomitant use of progestogens decreases the effect of cloprostenol.

Do not administer with non-steroidal anti-inflammatory Drugs (NSAID) as they inhibit endogenous prostaglandin synthesis.

Overdose

Cattle: At 5x to 10x overdose the most frequent side effect is increased rectal temperature. This is usually transient, however, and not detrimental to the animal. Limited salivation or transient diarrhoea may also be observed in some animals.

Horses: The most frequently observed side effects are sweating and decreased rectal temperatures. These are usually transient, however, and not detrimental to the animal. Other possible reactions are increased heart rate, increased respiratory rate, abdominal discomfort, locomotor incoordination and lying down. If these occur, they are likely to be seen within 15 minutes of injection and disappear within 1 hour. Mares usually continue to eat throughout.

Pigs: In general, an overdose can lead to the following symptoms: increased heart and respiratory rate, bronchoconstriction, increased body temperature, increased amounts of faeces and urine, salivation, nausea and vomiting.

There are no antidotes available, treatment should be symptomatically, assuming that prostaglandin $F2\alpha$ influences the smooth muscle cells.

Major incompatibilities:

In the absence of compatibility studies, this veterinary medicinal product must not be mixed with other veterinary medicinal products.

7. Adverse events

Cattle (cows and heifers):

Rare (1 to 10 animals / 10,000 animals treated):	Injection site infection ¹
Very rare	Anaphylaxis ² ;
(<1 animal / 10,000 animals treated,	Increased respiratory rate ³ ;
including isolated reports):	Increased heart rate ³ ;
	Abdominal pain ³ , Diarrhoea ^{3,5} ;
	Incoordination ³ ;
	Lying down ³ ;
	Retained placenta ⁴ , Metritis ⁴ , Dystocia ⁴ , Stillbirth ⁴ ;
	Restlessness, Frequent urination ^{3,5} ;

¹ May occur if anaerobic bacteria enter the injection site, especially following intramuscular injection, and may become generalized. Aggressive antibiotic therapy, particularly covering clostridial species, should be employed at the first sign of infection. Careful aseptic techniques should be employed to decrease the possibility of these infections.

Pigs (sows and gilts):

	Restlessness, Frequent urination ^{4,8} ;

¹ Haemorrhagic (anovular) follicles and multiple ovulations are reported in literature for horses treated with cloprostenol.

Reporting adverse events is important. It allows continuous safety monitoring of a product. If you notice any side effects, even those not already listed in this package leaflet, or you think that the medicine has not worked, please contact, in the first instance, your veterinarian. You can also report any adverse events to the marketing authorisation holder the local representative of the marketing authorisation holder using the contact details at the end of this leaflet, or via your national reporting system.

8. Dosage for each species, routes and method of administration

Intramuscular use.

Cattle (cows and heifers):

One dose equals 500 micrograms of cloprostenol per animal, corresponding to 2 ml of the veterinary medicinal product.

Oestrus induction and synchronisation:

⁵ In case of occurrence, these effects are observed within 15 minutes post-injection and usually disappear after one hour.

² May occur if anaerobic bacteria enter the injection site, especially following intramuscular injection, and may become generalized. Aggressive antibiotic therapy, particularly covering clostridial species, should be employed at the first sign of infection. Careful aseptic techniques should be employed to decrease the possibility of these infections.

³ Requiring immediate medical attention. Can be life-threatening.

⁴ Cloprostenol may cause effects similar to Prostaglandin F2α activity in the smooth muscles.

⁵ Appears to be transient and resolves without any treatment.

⁶ Mild.

⁷ May be caused by termination of gestation, depending on the date of treatment versus the date of conception, the incidence of placental retention may be increased.

Administer one dose per animal. When no oestrus symptoms are observed, a second dose can be administered after 11 days.

Treatment of clinical and subclinical endometritis in the presence of a functional corpus luteum (inflammation of the uterus):

Administer one dose per animal. If necessary, repeat the treatment 10-14 days later.

Treatment of ovarian luteal cysts:

Administering a single dose per animal.

Induction of parturition

Administer a single dose per animal, not earlier than 10 days before the expected date of calving.

Induction of abortion up to day 150 of gestation:

Administer a single dose per animal between the 5th and the 150th day of gestation.

Pigs (sows and gilts):

One dose equals 175 micrograms of cloprostenol per animal, corresponding to 0.7 ml of the veterinary medicinal product.

Induction of farrowing:

Administer a single dose per animal one or two days before the estimated date of parturition (see also warnings in section 3.5).

To be administered by deep intramuscular route with a needle at least 4 cm long.

Horses (mares):

Ponies and horses weighing less than 500 kg bodyweight:

One dose equals 125 - 250 micrograms of cloprostenol per animal, corresponding to 0.5 - 1 ml of the veterinary medicinal product.

Horses weighing more than 500 kg bodyweight:

One dose equals 250 - 500 micrograms of cloprostenol per animal, corresponding to 1 - 2 ml of the veterinary medicinal product.

Oestrus induction and synchronisation:

Administer a single dose per animal.

Termination of early gestation between day 5 and day 120:

Administer a single dose per animal not earlier than 5 days after ovulation.

- For 10 ml and 20 ml vials:
- The rubber stoppers of the vial may be safely punctured up to 10 times with 16-gauge needle.

- For 50 ml and 100 ml vial:

- The rubber stoppers of the vial may be safely punctured up to 10 times with 16-gauge needle. Otherwise, automatic syringe equipment, or a suitable draw-off needle, should be used to avoid excessive puncturing of the closure.

9. Advise on correct administration

10. Withdrawal periods
